1.1 Description of modification/addition to Linux

We will be modifying the chown .* command. The goal is to prevent the command from going into other directories and changing ownership of files. The command will only change ownership of all files in current directory.

1. 2 Rationale as to why this is a good idea, or what the good points of it are

This modification will prevent ownership of files in unintended directories from being changed. It will also avoid mistakenly giving ownership of files in directories to the wrong user.

1.3 Preliminary list of [possible] Linux modules that will be modified/affected

The chown command module.

1.4

Not sure yet if adding a new functionality to the common utility adds new modules.
